^aKIO₄ photometric method.

^bMolybdenum-blue photometric method.

See J. Res. NBS 26, 405 (1941) RP1386.

^c1-g sample burned in oxygen at 1,425 °C and sulfur dioxide absorbed in starch-iodide solution.

Iodine is liberated from iodide by titration, with standard KIO₃ solution. Titer is based on 93 percent of the theoretical factor.

^dDouble dehydration with intervening filtration.

^ePolarographic method.

^fChromium oxidized with ammonium persulfate and titrated potentiometrically with ferrous ammonium sulfate.

^gVanadium oxidized with nitric acid and titrated potentiometrically with ferrous ammonium sulfate.

^hActivation analysis method.

ⁱChromium volatilized as CrO₂Cl₂.

^jAlkalimetric method.

^kH₂S-CuS-CuO method.

^lElectrolytic method.

^mCuprizone photometric method.

ⁿOxidized vanadium titrated amperometrically with ferrous ammonium sulfate.

^oAtomic absorption method.

^pNeocuproine photometric method.

^qDimethylglyoxime gravimetric method.

The steel for the preparation of this standard was furnished by the Allegheny Ludlum Steel Corp., Brackenridge, Pennsylvania.

This Certificate of Analysis has undergone editorial revision to reflect program and organizational changes at NIST and at the Department of Commerce. No attempt was made to reevaluate the certificate value or any technical data presented in this certificate.

Gaithersburg, MD 20899

February 20, 1992

(Revision of certificate dated 7-13-66)

William P. Reed, Chief
Standard Reference Materials Program
